Exhibit A. Origin and Breeding History of the Variety**Soybean Variety 95B41**

Variety 95B41 evolved from a 1993 cross of 9584/{A4715/[9392/(9392/40-3-2)]}.

It is an F3-derived variety which was advanced to the F3 generation by modified single seed descent. The F4 progeny row of 95B41 was grown in the winter of 1994 in Puerto Rico. Subsequently, 95B41 has undergone two years of extensive testing and purification and has been observed by the breeder to be uniform and stable for all plant traits from generation to generation, with no evidence of variants. On the basis of yield, standability, and resistance to labeled Roundup Brand herbicides, variety 95B41 was released for sale.

The purification block was grown during the winter of 1995 in Costa Rica and bulked for increase. Two and one-half acres of 95B41 (breeders seed) were grown in the summer of 1996. 120 acres of parent seedstock (foundation seed equivalent) were grown in the winter of 1996 in Argentina and 5,000 bushels were harvested.

Exhibit B. Statement of Distinctness**Soybean Variety 95B41**

Variety 95B41 is most similar to 9584. Both varieties have white flowers, tawny pubescence, tan pods, and yellow seeds with black hila. However, 95B41 is resistant to labeled Roundup Brand herbicides whereas 9584 is not. 95B41 is also similar to A5547. However, A5547 is not resistant to labeled Roundup Brand herbicides. 95B41 is similar to AG5601, however, 95B41 has tawny pubescence whereas AG5601 has gray pubescence.
